Service recommendation

Table 2. Potential AI applications for the public sector.

AI Application	AI Value Creation and Functional Proposition	Public Sector Use Cases
AI-Based Knowledge Management (KM) Software	<ul style="list-style-type: none"> • Generation and systematization of knowledge – gather, sort, transform, record and share knowledge • Expert systems can support the codification of the knowledge of KM • Use of neural networks enables to analyze, distribute and share knowledge with others 	<ul style="list-style-type: none"> • Clinical documentation powered by AI (Lin et al. 2018) • ...
AI Process Automation Systems	<ul style="list-style-type: none"> • Automation of standard tasks; perform formal logical tasks with unpredictable conditions in consistent quality • Complex human action processes (formal logical or dangerous tasks) can be transferred to automation systems, which can support humans in performing tasks • May include rule-based assessment, workflow processing, schema-based suggestions, data mining, case-based reasoning, intelligent sensor technology • Robotic process automation has emerged as a sub-area through further technology innovations. This leverages the ability of software robots or AI-driven workers to mimic human interaction with user interfaces of software systems 	<ul style="list-style-type: none"> • Faster and higher quality request processing for immigration application forms (Chun 2007) • Automated image diagnoses (Collier et al. 2017) • Human-computer interaction for repetitive tasks like data entry etc. (Jefferies 2016) • ...
Virtual Agents	<ul style="list-style-type: none"> • Computer-based system that interacts with the user by means of speech analytics, computer vision, written data input but may also include real-time universal translation and natural language processing systems and affective computing • Software that can perform tasks for humans • Sub-areas are chatbots and avatars 	<ul style="list-style-type: none"> • Task allocation according to the respective area of responsibility of a specific agency (smart HR services) (Zheng et al. 2018) • Virtual nursing assistant (Collier et al. 2017) • A chatbot for helping refugees that seek asylum to fill out and search documents (Mehr 2017) • ...
Predictive Analytics & Data Visualization	<ul style="list-style-type: none"> • These analytics are based on quantitative and statistical analysis of data. • Processing of big data for reporting, prescriptive analysis and predictive analysis • Machine learning as a technical sub-area based on algorithms that can learn from data 	<ul style="list-style-type: none"> • Control and performance monitoring in public areas for police departments to determine terror threats and crime hotspots for preventive action (Power 2016) • Determine high crime-risk situations to secure public transport (Kouziokas 2017) • Forecast model to predict water levels (Kouziokas et al. 2017) • ...

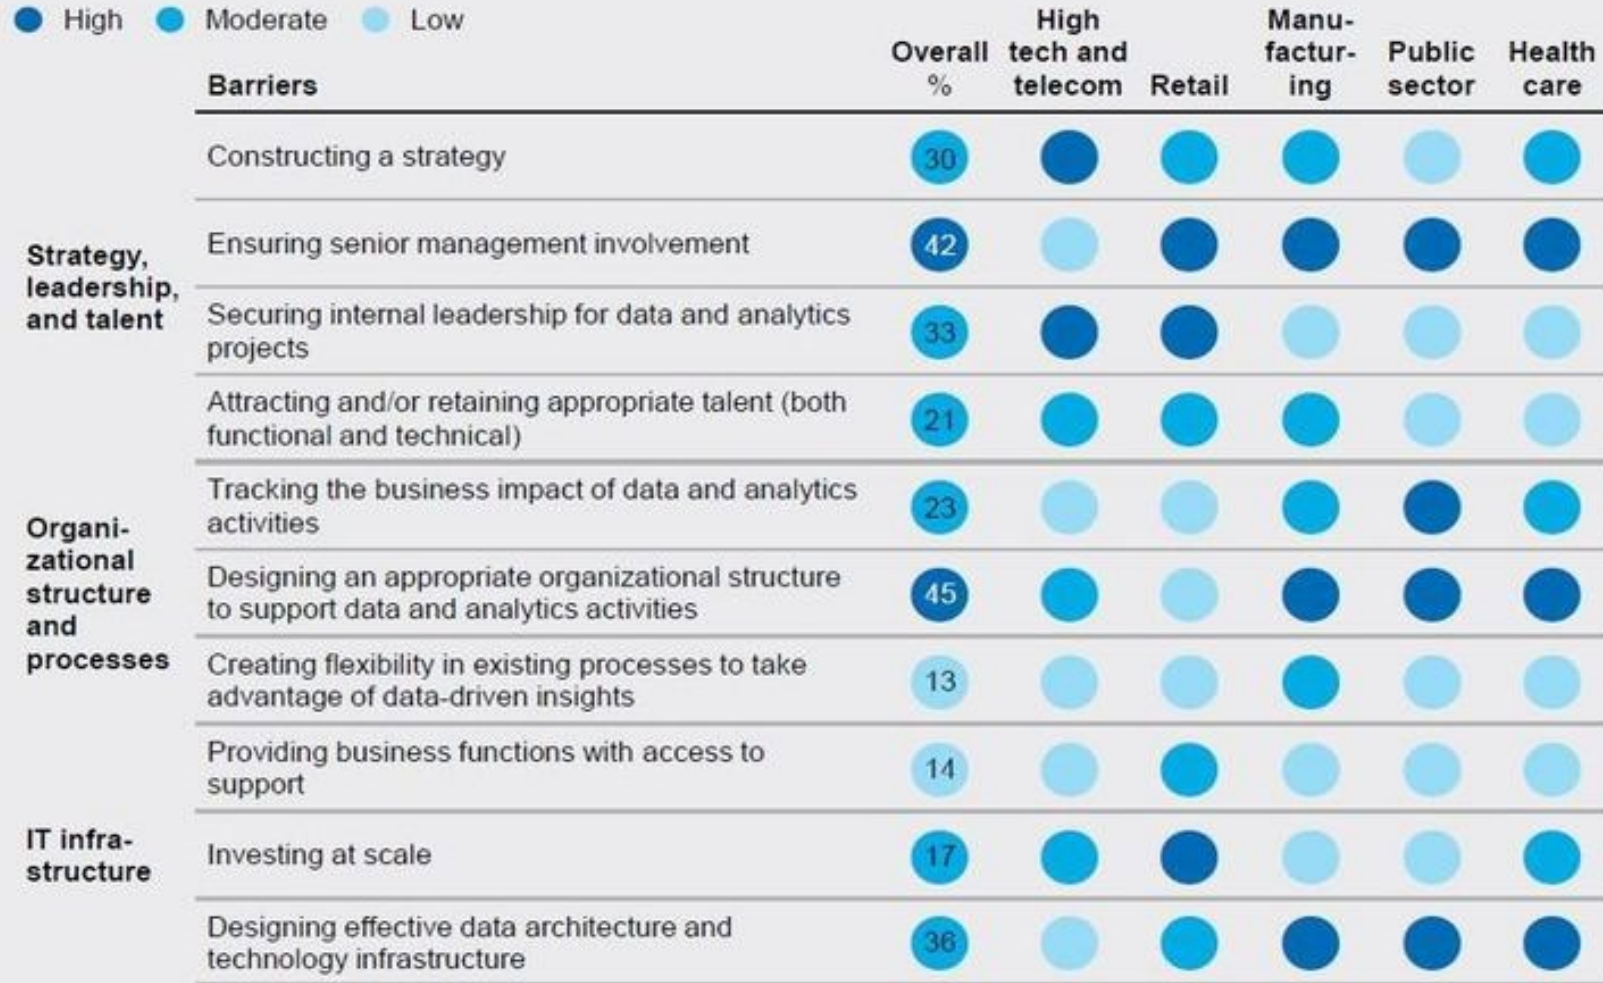

Identity Analytics	<ul style="list-style-type: none"> • Software combined with big data, advanced analytics and identity access management to control the access to IT systems and automate risk-based identity checks • May include deep learning and machine learning, affective computing and artificial immune systems 	<ul style="list-style-type: none"> • Facial recognition software to verify or identify criminals in public areas (Power 2016) • AI fraud detection to secure governmental data (Hemken and Gray 2016) • ...
Cognitive Robotics & Autonomous Systems	<ul style="list-style-type: none"> • Systems with higher-level cognitive functions that involve knowledge representation and are able to learn and respond • Sometimes in connection with affective computing to determine and adapt human behavior as well as respond to respective emotions 	<ul style="list-style-type: none"> • Electric-powered autonomous vehicles for public transport (Christchurch International Airport Limited 2016, Jefferies 2016) • Robot-assisted surgery (Collier et al. 2017) • ...
Recommendation Systems	<ul style="list-style-type: none"> • An information filtering system • Software-based systems that screen personalized information to predict preferences of individuals 	<ul style="list-style-type: none"> • E-service for government offices to provide personalized information for employees (Cortés-Cediel et al. 2017) • ...
Intelligent Digital Assistants (IDA)	<ul style="list-style-type: none"> • Software based on speech analytics • Providing an intuitive interface between a user and a system/device to search for information or complete simple tasks 	<ul style="list-style-type: none"> • Connecting federal programs to IDA's to make public service information available for customers (Herman 2017) • IDA-Amelia to help residents locate information and complete applications forms using speech analytics and affective computing (Jefferies 2016) • ...
Speech Analytics	<ul style="list-style-type: none"> • Software for intelligent recognition and processing of language • Understand or respond to natural language • Translate from spoken to written language or from one to another natural language • May include real-time universal translation and natural language processing systems (Pannu 2015) 	<ul style="list-style-type: none"> • Real-time universal translation (Microsoft 2018) to translate speech and text in face-to-face communications in public service settings • Administrative workflow assistance with voice to text transcription (Collier et al. 2017) • ...

Survey respondents report that strategic, leadership, and organizational hurdles often determine the degree to which they can use data and analytics effectively

Which of these have been among the TOP 3 most significant challenges to your organization's pursuit of its data and analytics objectives?

● High ● Moderate ● Low

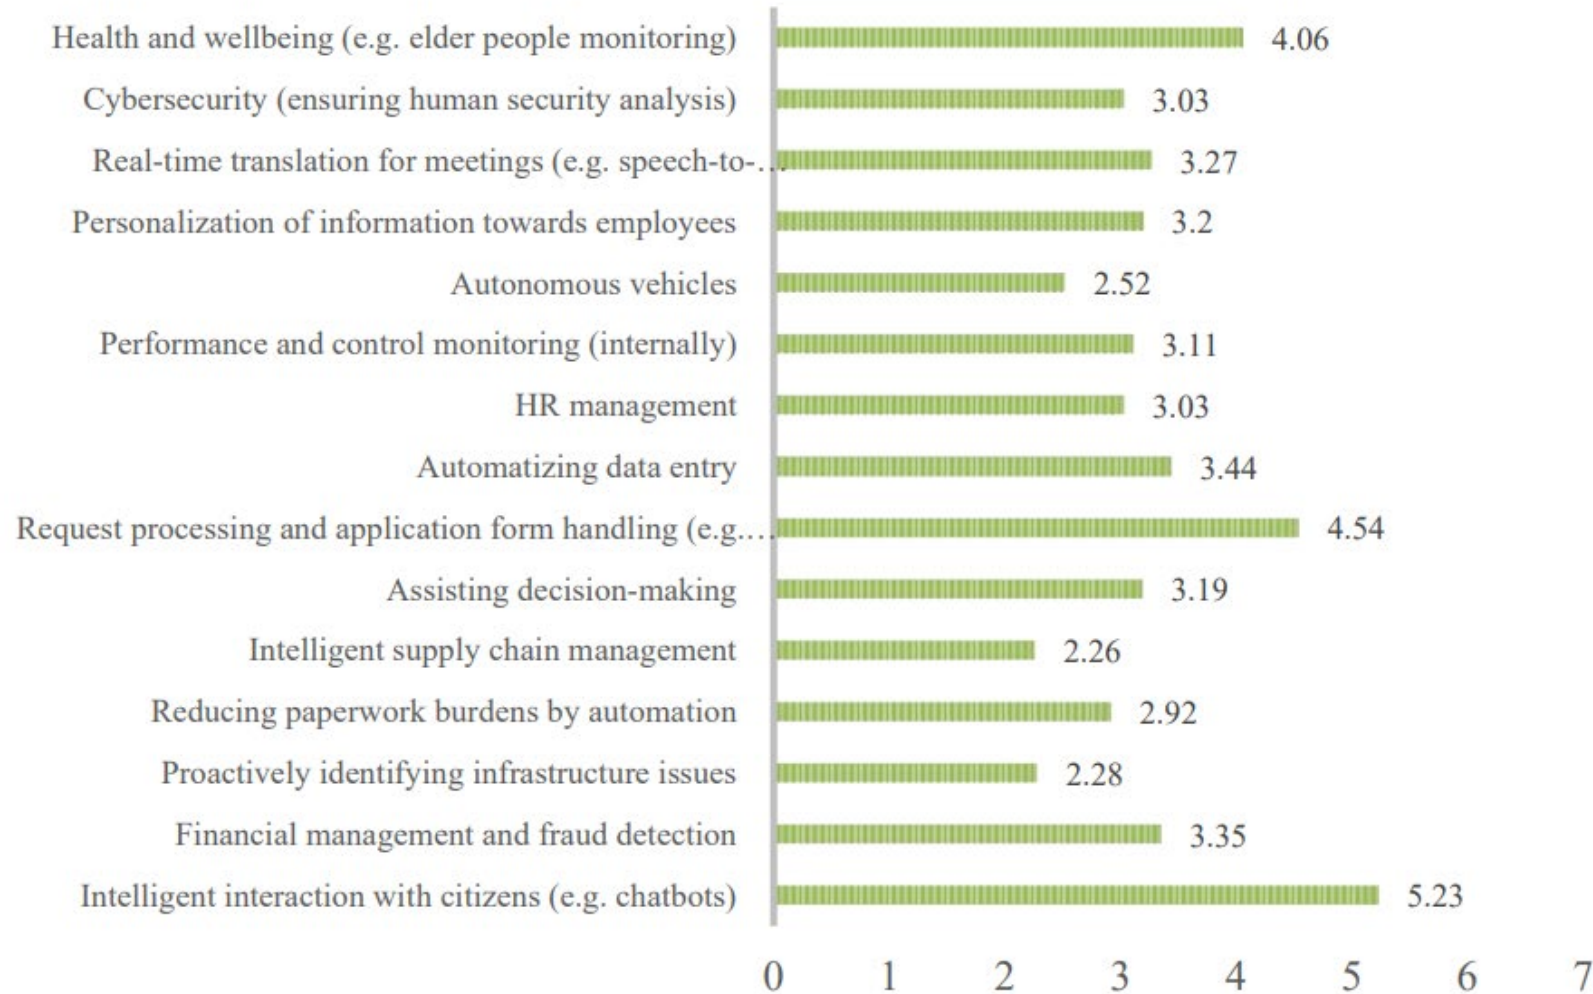

Fig. 2. Intention to adopt AI in Norwegian municipalities by area of use

- System/data quality ranks highest (5.02)
- Specialization and expertise is an important concern (4.68)
- Inertia – Organizational "Stickiness" (4.60)
- Financial feasibility (4.57)
